

Table S2. Stoichiometry of cell metabolism used in our simulation models.

A.
Neutral
Simulations

Reaction	Solutes		Particulates		Rate Expression
	G	E	X_{red}	X_{blue}	
X_{red} Growth	$-\frac{1}{Y}$		1		$\mu_{max} \frac{[G]}{[G] + K_G} X_{red}$
X_{blue} Growth	$-\frac{1}{Y}$			1	$\mu_{max} \frac{[G]}{[G] + K_G} X_{blue}$

B.
Competition
Simulations

Reaction	Solutes		Particulates		Rate Expression
	G	E	X_{E-}	X_{E+}	
X_{E-} Growth	$-\frac{1}{Y}$		$1 + B f([E])$		$\mu_{max} \frac{[G]}{[G] + K_G} X_{E-}$
X_{E+} Growth	$-\frac{1}{Y}$			$1 + B f([E])$	$\mu_{max} \frac{[G]}{[G] + K_G} X_{E+}$
Extracellular Enzyme Production		1		$-C$	$R_E \mu_{max} \frac{[G]}{[G] + K_G} X_{E+}$
f([E]) is a function of local extracellular enzyme concentration, $f([E]) = \begin{cases} 0, & [E] < \tau \\ 1, & [E] > \tau \end{cases}$
