

Table S4. Reactions for two genes expressed from the same and separate operons.

Reaction number	Reaction	Propensity	Parameter values
1	$\rightarrow mRNA_1$	$k_m g_1^*$	$5 \times 10^{-5}; 0.005; 0.05; 0.5^{**}$
2	$\rightarrow mRNA_2$	$k_m g_2^*$	$5 \times 10^{-5}; 0.005; 0.05; 0.5^{**}$
3	$mRNA_1 \rightarrow \emptyset$	$k_{mdeg} mRNA_1$	$0.0033 s^{-1}$
4 [†]	$mRNA_i \rightarrow \emptyset$	$k_{mdeg} mRNA_i$	$0.0033 s^{-1}$
5	$\rightarrow A$	$k_{tsn} mRNA_1$	$0.05 s^{-1}$
6 [†]	$\rightarrow B$	$k_{tsn} mRNA_i$	$0.05 s^{-1}$
6a [‡]	$\rightarrow A + B$	$k_{tsn} mRNA_1$	$0.05 s^{-1}$
7	$A \rightarrow \emptyset$	$k_{deg} A$	$0.0002 s^{-1}$
8	$B \rightarrow \emptyset$	$k_{deg} B$	$0.0002 s^{-1}$
9	$g_1 \rightleftharpoons g_1^*$	$k_{gon} g_1, k_{goff} g_1^*$	$k_{gon} = 0.00045 s^{-1}$
11	$g_2 \rightleftharpoons g_2^*$	$k_{gon} g_2, k_{goff} g_2^*$	$k_{goff} = 0.0028 s^{-1\$}$

[†]In transcriptionally coupled models, $i = 1$; in uncoupled models, $i = 2$.

[‡]In translationally coupled models, use reaction 6a in place of reactions 5 and 6.

^{**} Parameter k_m assumes slow promoter kinetics. Multiply values by 0.1395 to get equivalent expression for fast promoter kinetics ($k_{goff} = 0$). Four values represent the scan shown in Figure S1. The lower three used for multiple gene regulator module; the higher three used for all others. Expression levels used for examples in Figure 2: linear metabolic, 0.5; redundant metabolic, 0.5; divergent metabolic, 0.5; covalent modification, 0.05; multiple gene regulators, 5×10^{-5} ; physical interaction, 0.05.

[§] $k_{goff} = 0$ for fast promoter kinetics.
